

ROOMLINK

Guest Experience

Product Requirements Document

V1.0 - Pilot Release

Purpose

Give a hotel guest a fast, simple and secure way to request services and follow updates from their own room.

Access model

Static room QR + guest verification/PIN + temporary stay session. A QR alone never authenticates a guest.

CONFIDENTIAL

Prepared for product design, engineering, pilots, and future implementation reference.

Document Control

Item	Detail
Product	RoomLink
Document	Guest Experience Product Requirements Document
Version	V1.0 - Pilot Release
Classification	Confidential
Platform	Mobile-first responsive web / PWA
Primary user	Hotel guest with an active verified stay session
Pilot scenarios	110-room and 15-room hotels using the same guest access and request architecture

1. Objective

RoomLink is the guest's digital intercom with the hotel. It should replace the effort of calling Reception for ordinary service needs while keeping the guest informed.

- Open the correct hotel and room experience through the room QR.
- Verify access and create a temporary stay session before any service action.
- Request enabled hotel services, order restaurant items, and send messages.
- See clear request status and receive updates until the request is completed.

The guest experience must feel frictionless, but it must never allow a photographed or shared QR to provide unrestricted access.

2. Guest Access and Security

Step	V1 requirement
Scan QR	Static QR identifies Hotel + Room and opens the correct branded guest web experience.
Verify guest	Use the hotel-defined guest verification/PIN process before granting active access.
Temporary session	Create a time-bound stay session linked to the room and guest verification context.
Session end	Expire at checkout/end of stay; Hotel Admin / GM may terminate a session where required.
QR security	QR itself does not authenticate, reveal private guest data, or grant access to past/other guests.

3. Guest Home

After verification, the guest sees a simple home screen with hotel branding, welcome message, available services, Restaurant/Food ordering when enabled, request status, and a clear way to contact Reception.

- Show only services currently enabled and available for that hotel.
- Use clear category labels and mobile-sized touch targets.
- Show room context without asking the guest to re-enter the room number.
- Offer hotel instructions such as Wi-Fi, timings, emergency/Reception contacts where configured.

4. Service Requests

Guests can submit enabled requests which route to the configured hotel department. The guest does not need to understand internal department structure.

Category	Example V1 guest actions
Housekeeping	Request extra towels, water, toiletries, pillow, blanket or room cleaning.
Maintenance	Report AC, TV, Wi-Fi, plumbing, electricity or another issue.
Restaurant	Open the menu and place a food order where Restaurant is enabled.
Custom services	Request a hotel-configured item such as newspaper, dental kit or iron.

5. Request Submission

Capability	Requirement
Service details	Show service name, short description and optional guest note/instructions.
Confirmation	Immediately acknowledge creation and display request reference, room, selected service and status.
Priority	Guest may indicate urgency where the hotel enables it; hotel controls final operational priority.
Duplicate protection	Warn when an equivalent request is already active for the room/session, while allowing a justified new request.
Errors	Explain unavailable service or session problem in clear guest language and provide a Reception contact path.

6. Restaurant Menu and Orders

V1 Restaurant is lightweight guest ordering, not a full POS or payment system.

Menu / order feature	Requirement
Menu	Categories, item name, description, price, image where available, vegetarian/non-vegetarian label and availability.
Order	Select items and quantity; add optional instruction; submit to Restaurant department.
Availability	Unavailable items cannot be ordered and should explain that they are temporarily unavailable.
Status	Show submitted, accepted/preparing where supported, and completed/delivered update states.
Payment	No online payment, complex bill split or restaurant POS workflow required in V1.

7. Request Tracking and Messaging

Guest view	Requirement
Active requests	Show the guest's current room/session requests with service, submitted time and clear status.
Status updates	Use New, Assigned, In Progress, Completed; show Cancelled or Escalated with appropriate guest-friendly wording.
Conversation	Support messages with Reception/hotel workflow where enabled; distinguish hotel reply from internal status.
History	Show requests from the active stay session only; hide other guests' and prior stays' information.
Completion	Notify the guest when completed and optionally offer simple confirmation/feedback in a future release.

8. Reception Relationship

Reception is the hotel-wide coordination point visible to the guest. A guest request may be carried out by an optional Department Manager and staff, but the guest should experience a single RoomLink hotel service channel.

- Reception can communicate updates, coordinate a request, assign/reassign and escalate.
- Guest-facing wording remains clear and does not expose internal staffing or departmental complexity.
- For critical or urgent issues, clearly present a direct hotel emergency/Reception contact configured by the hotel.

9. Notifications and UX Requirements

- Use in-browser/PWA notifications where permission is granted; always retain in-app status visibility.
- Notify for new hotel reply, meaningful status change, completion, cancellation, and any action requiring the guest.
- Mobile-first, no app-store installation required for V1, minimal steps and accessible language.
- Provide loading, empty, error and success states; never leave the guest unsure whether a request was sent.
- Use hotel branding and clearly display hotel contact/help information.

10. Privacy, Safety and Data Boundaries

Principle	V1 requirement
Data minimization	Show only data necessary to operate the guest's active room/stay experience.
Isolation	Guests must never access another room, hotel, session or previous-stay request history.
Session protection	Verified temporary stay session is required for actions; static QR cannot bypass verification.
Emergency	RoomLink does not replace emergency procedures. The hotel provides emergency contact instructions.
Sensitive data	Do not expose staff personal data, internal notes, internal assignment details or hotel operational logs to guests.

11. Acceptance Criteria

Area	Acceptance criteria
Access	A guest can scan a room QR, verify access and start an active temporary stay session.
Security	A static or photographed QR alone cannot create unrestricted guest access.
Services	Guest can see only enabled services and submit a request with confirmation.
Restaurant	Guest can see availability and place a lightweight food order where enabled.
Tracking	Guest can see current request status and hotel messages for their active session.
Isolation	Guest cannot view other guests' data, another room, another hotel or expired-session history.
Support	Guest can reach the hotel's Reception pathway when service is unavailable or urgent.
Completion	Guest receives a clear completion update when the hotel completes the request.

12. Pilot Acceptance Tests

Pilot	Required guest test
Hotel A - 110 rooms	Guest scans QR, verifies stay, requests housekeeping/maintenance or food; Reception and Manager/Staff complete it; guest sees an accurate status and completion.
Hotel B - 15 rooms	Guest uses the same QR/session journey and submits a request that Reception assigns directly to cross-department staff Raju; guest sees the same simple experience.
Security test	A phone holding only a photographed QR cannot use RoomLink without the required temporary guest verification/session.

13. Non-Goals

- PMS/reservation integration, full check-in/check-out, keyless room entry and identity-document collection.
- Online payment, full restaurant POS, bill splitting, accounting and room-charge settlement.
- Guest loyalty, advanced CRM, AI chatbot, social login and permanent guest accounts.
- Cross-hotel access, staff contact directory, staff management or hotel configuration.

14. Final V1 Principle

For the guest, RoomLink is one simple service channel: scan securely, ask clearly, see progress, and know the hotel is taking care of the request.

The product may have departments, managers and staff behind the scenes, but the guest experience remains straightforward, private and hotel-wide.
