

ROOMLINK

Hotel Admin / GM

Product Requirements Document

V1.0 - Pilot Release

Purpose

Enable a hotel GM to configure and operate RoomLink independently - from hotel setup and QR codes to guest requests and operational oversight.

Deployment target

One 110-room hotel and one 15-room hotel, using the same V1 architecture.

CONFIDENTIAL

Prepared for product design, engineering, pilots, and future implementation reference.

Document Control

Item	Detail
Product	RoomLink
Document	Hotel Admin / General Manager Product Requirements Document
Version	V1.0 - Pilot Release
Classification	Confidential
Platform	Responsive web / PWA
Primary users	Hotel Admin / GM; supporting roles: Reception, Department Manager, Department Staff
Pilot scenarios	110-room hotel with managers; 15-room hotel without department managers

1. Objective

RoomLink is a hotel guest-service SaaS: a digital intercom connecting guests with hotel teams. This PRD defines the V1 Hotel Admin / GM workspace.

- Let a GM configure hotel operations without requiring RoomLink Super Admin for normal work.
- Support guest-service setup, monitoring, and intervention without becoming a full hotel ERP.
- Make a single architecture work for both a staffed 110-room hotel and a lean 15-room hotel.

V1 success question: Can the GM configure the hotel once and then let RoomLink run the guest-service workflow reliably?

2. Role and Scope

Role	V1 scope
Hotel Admin / GM	Hotel-wide configuration, visibility, reporting, user management, and operational intervention.
Reception	Hotel-wide guest-service monitoring, communication, assignment and escalation; no configuration authority.
Department Manager (optional)	Operates only the assigned department and its team.
Department Staff	Receives and completes eligible tasks for one or more assigned departments.
Guest	Uses a verified temporary stay session to request services and view updates.
RoomLink Super Admin	Platform administration; not needed for normal hotel operations.

The Hotel Admin cannot access other hotels, platform-wide administration, other customers, or Super Admin controls. Subscription visibility may be provided, but platform billing administration is out of scope.

3. Dashboard

The dashboard is the first screen after login and provides a real-time hotel operating view.

Area	Requirements
KPI cards	Today's requests, pending, in progress, completed, active rooms, active staff, enabled departments, unread guest messages.
Department summary	Pending, in-progress and completed counts by department.
Alerts	Unassigned or delayed requests, unavailable staff, unavailable restaurant items, QR not activated, important guest messages.
Actions	Open filtered request queue, inspect department workload, navigate to the affected setup entity.

4. Hotel, Legal and GST Profile

The GM can maintain the hotel master information below. GST is optional during initial onboarding but should be completed before RoomLink billing where the hotel is GST-registered.

Group	Fields
Hotel identity	Hotel/property name, brand name, logo, description.
Address and contact	Address, city, state, pincode, country, phone, email, website, timezone.
Legal / billing	Legal business name, GSTIN, PAN (optional in V1), billing address and billing email.
Operations	Check-in time, check-out time, breakfast timing, restaurant timing, hotel contact details.

5. Department Management

Departments are optional per hotel. The GM enables only what the property needs, and may rename templates or add a custom department. Default templates: Reception, Housekeeping, Restaurant, Maintenance, Room Service, Laundry, Spa & Wellness, and Concierge / Transport.

- Enable, disable, rename, and create departments.
- Configure department services, staff, and an optional manager.
- Disabling a department must prevent new guest requests from routing there while preserving historical records.

Reception is a hotel-wide coordination function, not a limitation on department configuration.

6. Optional Department Managers

Every enabled department may have one Department Manager or no manager. A manager is never mandatory.

Scenario	Routing and accountability
Manager assigned	Reception coordinates; the manager manages the departmental queue and staff.
No manager	Reception assigns to eligible staff; Hotel Admin / GM directly manages the department.

- Assign, change, remove, view, and disable a manager account.
- Restrict a manager to the department(s) assigned to them.
- Allow GM intervention in either operating model.

7. Multi-Department Staff

A staff member may belong to one or many departments within the same hotel. This is a firm V1 architectural requirement. Department membership is a many-to-many relationship, not a single department field on staff.

Staff field / action	Requirement
Staff fields	Name, mobile, email, employee ID, role, department memberships, status.
Department membership	Select one or more departments; add or remove memberships at any time.
Lifecycle	Create, edit, activate, deactivate, reset access.
Task eligibility	For V1, membership in a department means the staff member is eligible for that department's tasks. Skill-level permissions are future scope.

Example: In the 15-room pilot, Raju may serve Housekeeping + Restaurant + Maintenance and receive eligible work from all three.

8. Rooms and QR Codes

The GM manages active rooms and their unique RoomLink QR codes.

Capability	Requirements
Rooms	Add, edit, deactivate/reactivate, search and filter by floor, room type and status. Fields: room number, floor, type, status.
Bulk import	CSV/Excel import for fast onboarding, especially for the 110-room pilot.
QR lifecycle	Room created -> QR generated -> downloaded/printed -> installed -> active.
QR actions	Generate, regenerate, download, print, mark installed, deactivate.

Security principle: the static QR identifies the hotel and room only. It does not authenticate a guest.

9. Guest Sessions

Guest access uses a static room QR plus guest verification/PIN and a temporary stay session. A photographed QR must not provide unlimited access.

- Show GM-level session overview: room, session status, and check-out/expired state.
- Allow the GM to manually terminate a guest session when required.
- Limit guest actions and request history to the active temporary stay session.

10. Guest Services

The GM configures services guests can request and maps them to a department. Default V1 examples:

Department	Example services
Housekeeping	Extra towels, water, toiletries, pillow, blanket, room cleaning.
Maintenance	AC issue, TV issue, Wi-Fi issue, plumbing, electricity, other.
Restaurant	Food ordering.
Custom	Newspaper, dental kit, iron, or a hotel-specific service.

11. Restaurant Menu

Restaurant configuration is deliberately lightweight, not a restaurant POS.

- Manage categories such as Breakfast, Starters, Main Course, Beverages, Desserts.
- Menu item fields: name, description, price, image, category, vegetarian/non-vegetarian, availability.
- Add, edit, disable, mark unavailable, and change price.

12. Request Monitoring

The GM can view all guest requests across the hotel. Requests must show room, service, department, assignee, timestamps, priority and current status.

Item	Requirement
Filters	Department, status, priority, room and date.
Core states	New -> Assigned -> In Progress -> Completed.
Optional states	Cancelled and Escalated.
GM actions	View details, monitor queues, intervene, reassign/escalate where necessary.

13. Reception Relationship

Reception has hotel-wide guest-service monitoring. The GM sees everything Reception sees, but with additional management and configuration authority.

Reception may	Reception may not
Monitor requests; communicate with guests; assign/reassign; escalate.	Add staff; configure departments; change menu; change hotel settings.

14. Notifications

The GM receives actionable operational alerts. V1 channels are in-app and push notifications; email and SMS are later scope.

- Critical guest request or maintenance issue.
- Unassigned request, SLA breach, department issue, staff availability issue.
- Important guest message and restaurant item unavailability.

15. Settings

Settings area	V1 controls
General	Hotel profile, logo, contact details, timings, Wi-Fi details.
Guest experience	Welcome message, enabled services, guest instructions.
Notifications	Enable/disable preferences and critical-alert preferences.

16. User Management

The GM can create and manage Reception users, optional Department Managers, and Department Staff. Staff can belong to multiple departments. Each account has status and access-reset controls.

17. Audit and Activity

The GM sees a basic hotel activity log, for example: a request completed, menu item marked unavailable, staff added, or room QR regenerated. The complete security audit remains available to RoomLink Super Admin.

18. Navigation

Primary nav	Sub-sections
Dashboard	Hotel-wide KPIs and alerts
Hotel	Hotel Profile, Departments, Rooms, QR Codes
People	Staff, Managers
Guest Services	Services, Requests, Restaurant Menu
Operations	Activity, Notifications
Subscription	Plan & Usage
Settings	General, Guest Experience, Notifications

19. Acceptance Criteria

The Hotel Admin / GM module is complete only when the GM can independently perform each of the following.

Area	Acceptance criteria
Hotel	Configure hotel profile, legal/GST details and operating times.
Departments	Enable/disable departments, create custom department, assign or omit a manager.
People	Create staff, assign one or multiple departments, disable staff, manage Reception and managers.
Rooms	Create/import rooms, generate and download QR codes.
Services	Configure housekeeping, maintenance, restaurant and custom services.
Restaurant	Add menu items, change prices, enable/disable availability.
Operations	View/filter all requests, inspect status and activity, receive alerts.
Guest	View and terminate guest sessions when necessary.

20. Pilot Acceptance Tests

Pilot	Setup	Mandatory end-to-end test
Hotel A - 110 rooms	Reception; Housekeeping, Restaurant and Maintenance Managers; multiple staff.	Guest -> QR -> request -> Reception -> Manager -> Staff -> Complete -> Guest. Must work end-to-end.
Hotel B - 15 rooms	Reception; no Department Managers; Raju belongs to Housekeeping + Restaurant + Maintenance.	Guest -> QR -> request -> Reception -> Raju -> Complete -> Guest. Must use the same application and database architecture.

The two pilots prove that RoomLink adapts to different hotel staffing models without product forks or bespoke database design.

21. Non-Goals

- PMS integration, reservation management, full check-in/check-out.
- Payroll, inventory, accounting, complex billing, advanced revenue management.
- Advanced hotel CRM, loyalty program, AI chatbot.
- Sophisticated restaurant POS functionality.
- Service-specific skills/certifications and advanced staff scheduling.

22. Final V1 Principle

Optional departments + optional Department Manager + multi-department staff + hotel-wide Reception monitoring. This is the RoomLink V1 operating model for every pilot hotel.

RoomLink V1 should remain focused: configure a hotel quickly, connect verified guests to the right hotel team, and give the GM reliable oversight of the guest-service workflow.
